

# Enabling an AI-Powered Workforce to Achieve Maximum Productivity

Demonstration of a proven, viable workflow that exploits the agentic capabilities of AI to accelerate teams in their research, development, and release of technical solutions at scale.

Software Engineer

JUNE 23, 2026

# Objective

My goal for today is that you leave with an architectural-level, working understanding of the framework that you will take with you by the end of this session. You should be able to then relate this to your engineer — and have them adapt and build it for your specific environment.

License: MIT

01 · CATALYST

## Origin

Transitioning into AI-based work

02 · ARCHITECTURE

## The Librarian

Workflow and information architecture concepts

03 · FRAMEWORK

## Project Ventura

A free, generalized framework you can connect to your own knowledge base.

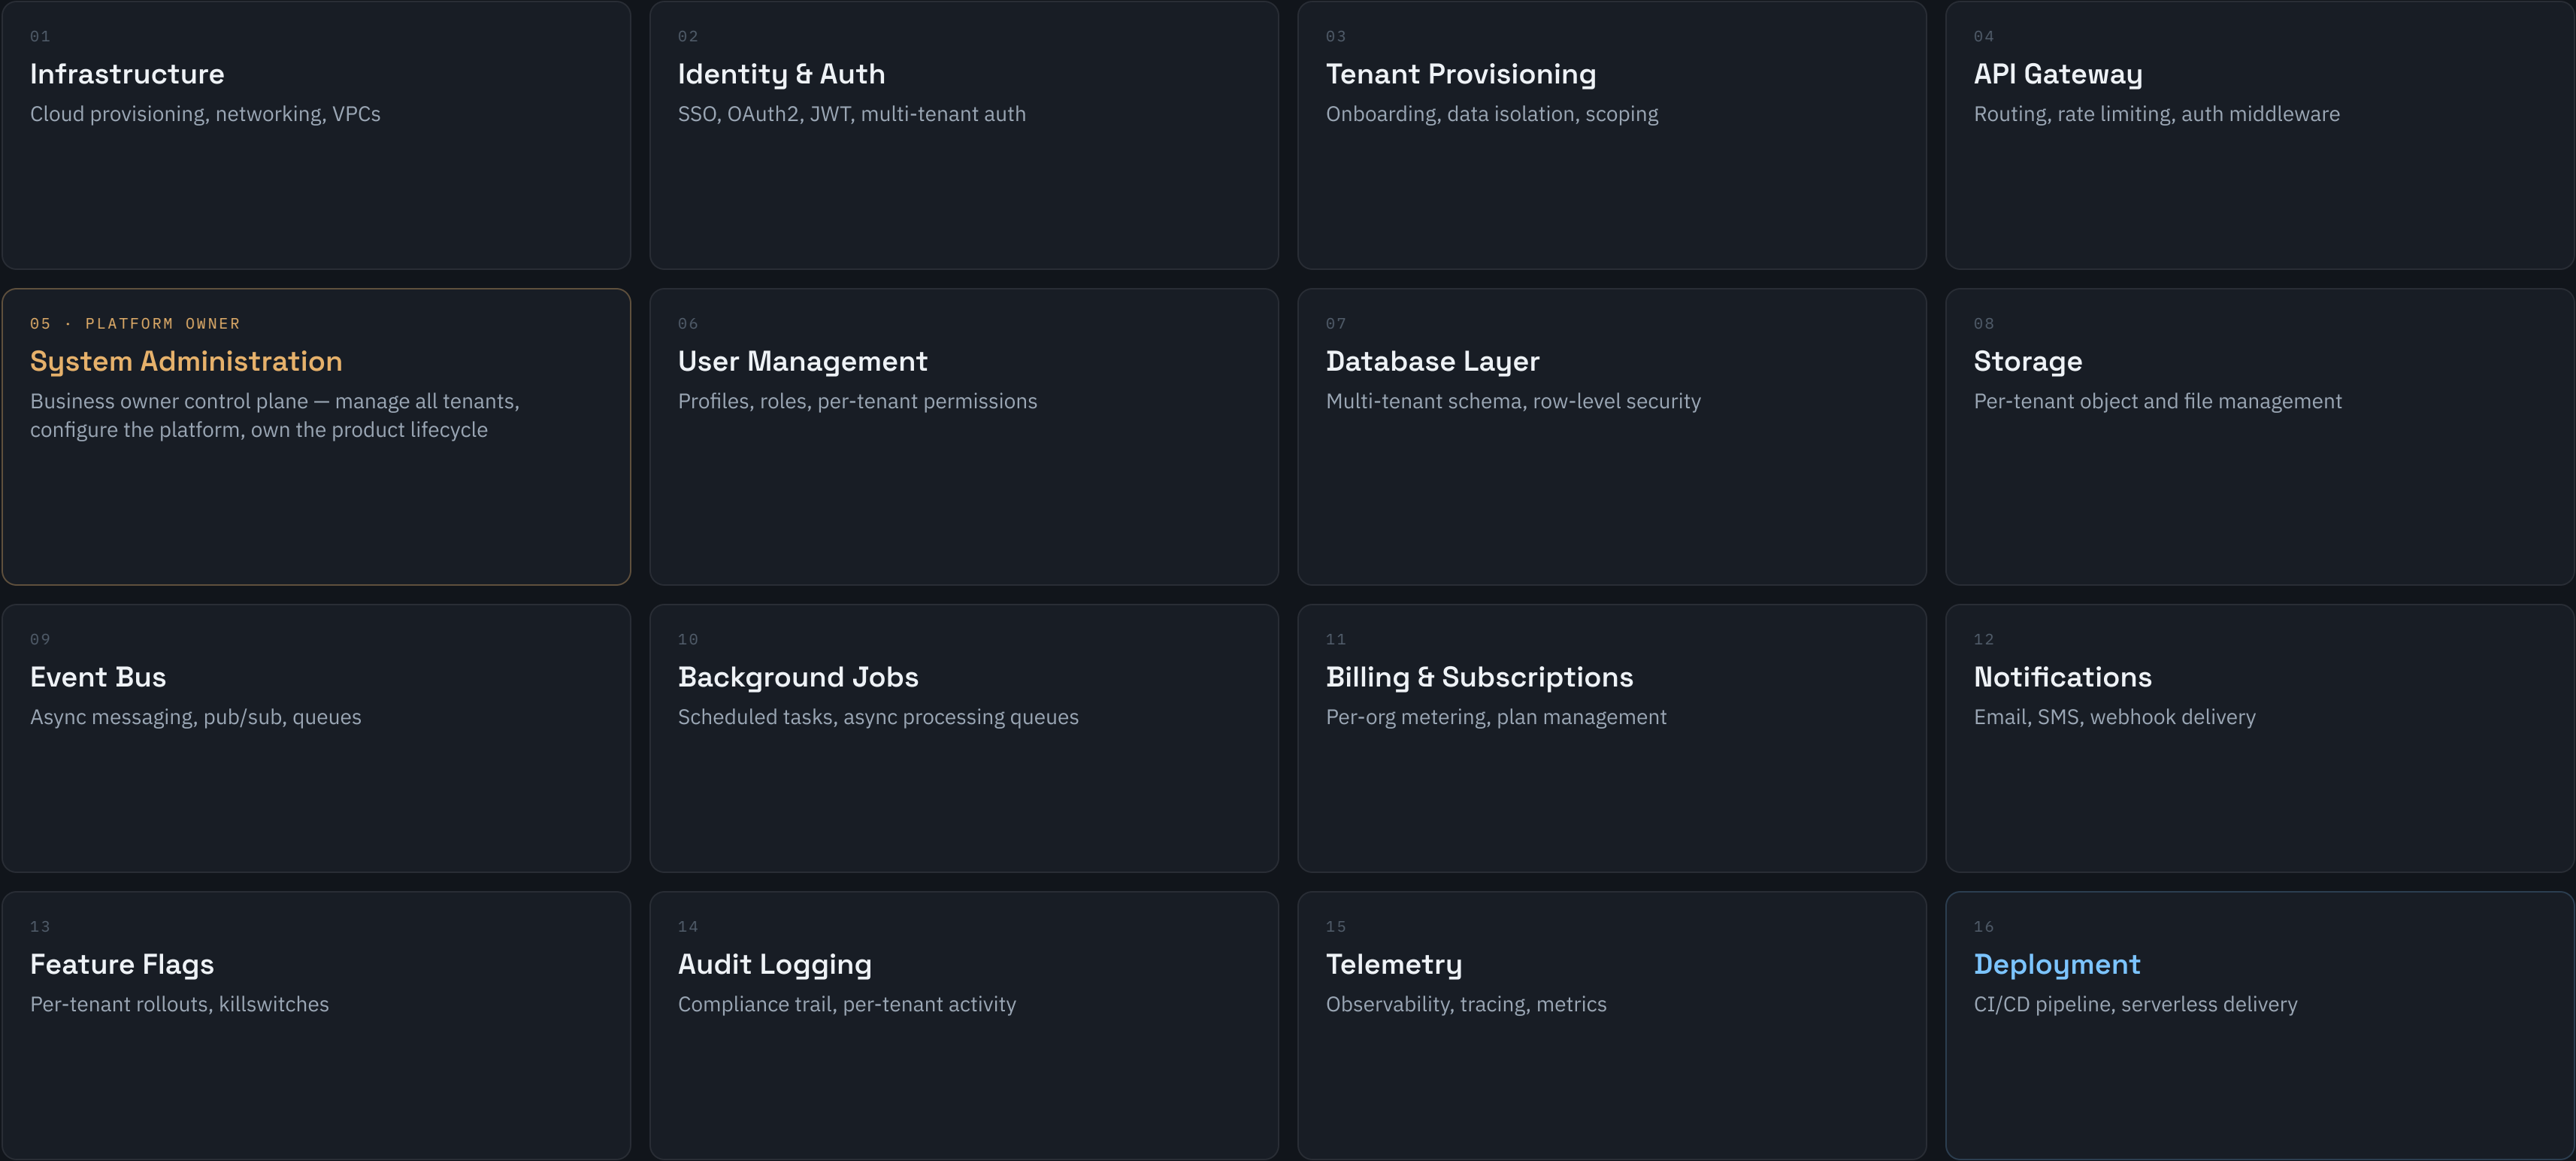

# Origin Story

SaaS Co-Founder / No-Founder

04

# A multi-tenant B2B serverless SaaS — built by agentic AI

Risk: Business-to-Business customers are entire organizations (not individuals) with stakeholders; and they serve an entire industry.

“

**There is a very specific line between what AI can lead — and what you have to lead.**

If you don't have the foundational knowledge to validate the output, you will not catch the errors. And they compound. Even on the frontier model at max reasoning, correction and intervention are required.

ARCHITECTURE

# The Librarian

See [Project Architecture](#)

PART THREE · THE FRAMEWORK

# Project Ventana

A generalized RAG framework for your environment.

[mattborja/project-ventana](https://github.com/mattborja/project-ventana)

03

# A knowledge base built for navigation.

The repository uses a recursive index-and-rules pattern. At every level, an index points the agent toward the right branch, and a short rules file says how to behave there.

The agent reads the index **first**, then drills to exactly what it needs — never loading the whole library to answer one question.

```
knowledge-base/  
├─ INDEX.md ← read first  
├─ RULES.md  
├─ billing/  
  │ └─ INDEX.md  
  │ └─ specs...  
└─ identity/  
  └─ INDEX.md
```

# Pipeline (Retrival Augmented Generation)

# Thank you.
